

RTFKT — The Warning & The Signal

Interface Design for a Digital World

For this project, I was invited to design and animate a series of fictional interfaces created specifically for two RTFKT videos: *The Warning* and *The Signal*.

My role was to develop the visual language, interface layouts, monitoring systems, radar displays and animated UI elements that would appear on screens throughout both films.

Unlike a traditional product interface, these designs needed to work as part of the story. Every screen had to feel functional and believable within its environment while also contributing to the visual identity and atmosphere of the films.

The project combined **UI design, motion design and interface animation**, creating digital systems designed specifically for cinematic storytelling.

The Warning

Interfaces Inside the Pod

The first part of the project focused on *The Warning*.

The interfaces initially appear on a transmitter located inside the character's pod. These screens were designed as monitoring and communication systems, displaying different types of data, signals and visual information.

The challenge was to create interfaces that felt technologically advanced while still belonging naturally to the physical environment shown in the film.

Rather than designing static graphics, the screens were developed as active systems. Data, indicators, radar elements and monitoring information were animated to give the impression that the technology was constantly processing information.

Visuals to show:

- The transmitter inside the pod
- Interface close-ups
- Monitoring data
- Radar systems
- UI animation breakdowns
- Final shots from the film

A Portable Transmission Device

Later in the film, the interface appears again on a portable transmitter carried by the protagonist.

This required adapting the visual language developed for the pod while considering a completely different physical context.

The interface needed to remain consistent with the technology introduced earlier in the story while functioning within a smaller and more compact device.

I designed and animated the screens to communicate different types of information through data visualization, signals and animated interface elements, helping reinforce the idea of an active communication and monitoring system.

Visuals to show:

- Portable transmitter
- Interface details
- Signal animations
- Data visualization
- Radar and monitoring elements
- Final sequence in context

The Signal

Before the Transformation

The second part of the project focused on *The Signal*.

In this film, the interface begins as part of a monitor used by one of the characters. The screen initially presents a functional digital system, creating the impression of a familiar technological environment.

My work involved designing and animating the interface displayed on this monitor, including the visual behavior of the system and its loading sequence.

However, the interface was also an important part of a much larger transformation happening within the story.

Visuals to show:

- Initial monitor
- Loading sequence
- Interface animations
- Screen interactions
- UI details before the transformation

Touching the Signal

At a key moment in the film, the character interacts directly with the touchscreen.

After this interaction, the entire environment begins to transform — including the monitor itself.

The original display evolves into a large curved ultrawide screen, creating an opportunity to completely change the visual language of the interface.

The new system was designed to feel more advanced and immersive, taking advantage of the wider format and the transformation happening around the character.

This transition allowed the interface to become part of the narrative transformation rather than simply remaining a screen inside the environment.

Visuals to show:

- Touch interaction
- Transformation sequence
- Environment before and after
- Monitor transformation
- Ultrawide curved display
- Interface transition

A New Interface for a New Environment

Once the transformation is complete, the interface adopts a more modern visual direction.

The larger curved screen allowed for a different composition and information hierarchy, creating a system designed specifically for the new environment.

The goal was to make the transition feel natural: the technology itself evolves alongside the world around it.

From the first loading screens to the final ultrawide interface, the animation helped connect each stage of the transformation and reinforce the relationship between the digital system and the physical space.

Visuals to show:

- Final ultrawide interface
- Full-screen composition
- Animated UI elements
- Monitoring systems
- Interface details
- Final shots from the film

Designed for the Story

Across both *The Warning* and *The Signal*, my role was to create interfaces that could exist naturally inside their respective worlds.

The work involved designing the visual systems from scratch and bringing them to life through animation, creating everything from monitoring displays and radar systems to transmission data and interactive screens.

More than creating screens to be displayed inside the videos, the goal was to make each interface feel like a functional part of the technology and storytelling.

My contribution included:

- UI Design
- Interface Art Direction
- Monitoring Systems
- Data Visualization
- Radar Interfaces
- Transmission Interfaces
- Motion Design
- UI Animation
- Loading Sequences
- Screen Transitions
- Futuristic Interface Design
