

Nicktoons & The Dice of Destiny

UI Design & Illustration

For *Nicktoons & The Dice of Destiny*, I worked on the development of the game's UI, helping define and solve visual and functional challenges across a wide range of interfaces.

The project required much more than designing individual screens. Each system needed to feel consistent with the game's illustrated fantasy world while remaining clear, readable and intuitive during gameplay.

My work covered everything from core navigation and system menus to character progression, inventory, map navigation, abilities and smaller UI elements used throughout the game.

A large portion of the interface was also illustrated manually, allowing the UI to feel like a natural extension of the game's visual identity rather than a separate layer placed on top of it.

Building a Visual Language

One of the main challenges was creating a consistent visual language that could work across very different types of interfaces.

Menus, panels, buttons, icons and information screens were designed around a combination of parchment textures, hand-drawn ornaments, illustrated elements and a color system that helped organize information and interactions.

The interface also needed to support multiple Nickelodeon characters and environments while maintaining the same overall visual language throughout the game.

This approach allowed the UI to feel cohesive across screens with very different purposes.

Visuals to show:

- Main menu
- Settings
- Load game
- Character selection
- Inventory
- Map

Menus & System Interfaces

I worked on several of the game's core system interfaces, including the main menu, settings screens and save/load interfaces.

These screens required a balance between the game's illustrated aesthetic and the practical needs of a game menu: clear hierarchy, readable information and intuitive navigation using controller inputs.

Rather than relying on generic UI components, the interfaces were built around custom shapes, textures, decorative elements and illustrated details that reinforced the game's fantasy-book visual language.

Visuals to show:

- Main menu
- Settings
- Load game
- Menu navigation
- Controller interaction states

Character Selection

The character selection screen was designed to support a roster of characters from the Nickelodeon universe while maintaining the same visual language established throughout the game.

The interface combines character portraits, large character illustrations, player indicators and color-coded information to make multiplayer selection easy to understand at a glance.

The surrounding parchment-based layout and illustrated details help connect the interface to the game's broader fantasy aesthetic.

Visuals to show:

- Full character selection screen
- Character states
- Player indicators
- Character portraits and illustrations

Inventory & Progression

I also worked on the inventory and character progression interfaces, creating systems for displaying equipment, attributes, item information and player progression.

The inventory combines a large item grid with character information and detailed item descriptions, requiring careful organization of a considerable amount of information within a single screen.

The interface was designed to maintain readability while still preserving the illustrated and handcrafted character of the game.

Visuals to show:

- Full inventory screen
- Item selection
- Character statistics
- Item details
- Equipment states

Potion Upgrade System

One of the more specific interfaces I worked on was the potion upgrade system.

The screen needed to communicate different upgrade paths, available levels, costs and the current state of each upgrade in a way that was immediately understandable to the player.

I developed the visual elements and illustrations used to differentiate the upgrade levels, locked states and available upgrades while maintaining the game's parchment and illustrated visual language.

Visuals to show:

- Full potion upgrade screen
- Individual upgrade states
- Icons
- Locked/unlocked variations
- Interaction states

Map & Navigation

The game's map required another layer of information hierarchy, combining the illustrated world with navigation, progression and level information.

I worked on UI elements used to identify areas, stages, objectives and their different states, creating icons and markers that could communicate information without competing with the artwork underneath.

The result was an interface that integrates directly with the illustrated map rather than treating navigation as a separate UI layer.

Visuals to show:

- Full map
- Area selection
- Stage markers
- Locked/unlocked states
- Map icons

Icons & Gameplay Indicators

Beyond the larger interfaces, I also created a variety of smaller UI elements used throughout the game.

This included map icons, difficulty indicators, gameplay symbols, ability indicators and other visual components required by different systems.

Many of these elements were illustrated manually, allowing them to maintain the same hand-drawn quality and visual language as the rest of the interface.

The skill area-of-effect indicator was another example where the UI needed to communicate gameplay information clearly while still fitting naturally into the game's visual world.

Visuals to show:

- Difficulty icon progression
- Skill area indicator
- Map icons
- Gameplay icons
- Different states and variations

Designed as Part of the Game World

The main goal throughout the project was to make the interface feel like part of the game rather than something placed on top of it.

From the larger screens to the smallest icons, the UI was developed around the same illustrated language, combining functional design with hand-crafted visual elements.

Working across so many different systems also meant solving very different interface problems while maintaining consistency — from menus and inventory management to character selection, progression systems and real-time gameplay indicators.

My contribution included:

- UI design
- Interface problem solving
- Screen layouts
- Icon design
- UI illustration
- Gameplay indicators
- Menu and system interfaces
- Character selection
- Inventory
- Map UI
- Progression systems
- Potion upgrade interface
