

Authentic Games — No Império Desconectado

Opening Sequence

The first challenge of the project was to develop the film's opening sequence, introducing the *Authentic Games: No Império Desconectado* logo in a way that reinforced the technological universe of the story.

The concept was built around a space filled with cubes gradually emerging from the horizon and moving toward the camera, progressively taking over the screen until culminating in a Big Bang-inspired explosion. From this explosion, the film logo was launched toward the camera, while loose Ethernet cables generated electrical discharges around the title.

The sequence combined different techniques in After Effects. The cubes were created using a particle system, while the electrical discharges were animated frame by frame, allowing for a more organic and controlled result.

Visuals to show:

- Final opening sequence
- Animation breakdown
- Particle system setup
- Tests or frames from the lightning animation
- Individual elements vs. final composition

Post-Production & VFX

After completing the opening, I moved into the film's post-production, taking on one of the most extensive stages of the project.

I was responsible for the color grading of the scenes and for applying VFX to specific sequences, working with elements such as reflections, lighting and additional effects to better integrate the 3D assets and reinforce the atmosphere of each scene.

Alongside the visual work, I was also involved in editing the material and reviewing renders delivered by the 3D team. This required constant attention to detail to identify rendering issues, visual inconsistencies and technical problems that needed to be sent back to the 3D team for correction.

It was a demanding stage that required both visual precision and responsibility, particularly when dealing with a large amount of material and ensuring that issues were identified before the final delivery.

Visuals to show:

- Before/after color grading
- VFX comparisons
- Reflection and lighting examples
- Short VFX breakdowns
- Render issues and their corrections

Credits Sequence

I then moved on to the animation of the film's credit sequence.

Instead of using a traditional presentation based solely on a black screen, we decided to incorporate concept art from the film's universe and turn the static artwork into animated environments.

I prepared the artwork in Photoshop, separating and rebuilding the necessary elements so they could be animated later in After Effects.

Using these originally static images, I created camera movements and different levels of depth through parallax, transforming the concept art into small animated scenes that accompanied the credits.

Visuals to show:

- Original concept art
- Photoshop preparation
- Layer separation
- Parallax breakdown
- Final credits sequence

Key Art & Cover Design

Another important stage of the project was the development of the film's cover artwork.

The initial composition had already been created by a concept artist and served as the visual foundation for the piece, defining the character positions, composition and overall direction. My role was to turn this concept into a final piece using 3D character renders produced specifically to match the positions established in the original artwork.

I rebuilt the composition in Photoshop, combining image compositing, retouching and digital painting to bring the 3D renders closer to the visual language of the original concept.

A significant part of the work was done manually, particularly when creating lighting, shadows and rim lights. The goal was to make all the different elements feel as though they belonged to the same environment rather than simply combining 3D renders with a background.

The result was a hybrid process combining **compositing, image manipulation and digital painting**, transforming the 3D assets into a finished piece of visual communication.

Visuals to show:

- Original concept art
- 3D character renders
- Intermediate composition
- Lighting and painting details
- Before/after comparisons
- Final cover artwork

Marketing Materials

After the film was completed, I was also invited to contribute to the creation of its marketing materials.

My previous experience working in advertising agencies became particularly valuable during this stage, as the challenge shifted from simply representing the film's visual universe to creating communication pieces with different purposes.

I developed materials designed to highlight key moments and aspects of the film, invite audiences to watch it, and introduce the voice actors and their characters.

One of the pieces I particularly enjoyed working on was an animated version of the cover artwork I had previously created. Starting from the static composition, I introduced depth, camera movement and visual effects to transform the artwork into an audiovisual piece for promotion.

Visuals to show:

- Promotional pieces
- Character-focused materials
- Voice actor materials
- Different format adaptations
- Animated cover
- Static cover vs. animated version

One Project, Multiple Disciplines

Authentic Games: No Império Desconectado was a project where I had the opportunity to contribute across multiple stages of production, from the film's opening sequence to its promotional campaign.

Motion design, VFX, color grading, editing, compositing, digital painting, graphic design and marketing all came together within the same production.

More than working on isolated deliverables, the project allowed me to follow the material through different stages of production — identifying problems, finding solutions and adapting the film's visual language to different creative and communication needs.
